<p>A new beta-mannanase has the following characteristics; it hydrolyses the beta-1,4-D-mannopyranoside bonds of mannan, glucomannan, galactomannan and galactoglucomannan unsingularly to generate mannooligosaccharides; it acts on beta-mannan singularly but does not act on alpha-mannan; it is suited at pH 8-10 and stable at pH 6-10 when heated for 30 mins. at 60 deg.C, while stable up to at 65 deg.C when heated for 30 mins. at pH 8.0; it is inhibited by mercuric chloride, Ag nitrate, (EDTA) Na2, urea, dodecyl Na sulphate and dodecyl benzene Na sulphonate; it has an isoelectric pt. at 5.3-5.4, when measured by chromatofocusing; and it is 37,000 (+/-) 3,000 in mol. wt. when measured by gel filtration. The beta-mannanase is mfd. by culturing a beta-mannanase-generative microbe belonging to Bacillus having its suitable pH at alkalinity to allow it to generate the beta-mannanase in the culture soln. and collecting it. USE/ADVANTAGE - The beta-mannanase is mfd. at low cost. (8pp Dwg.No.0/0)</p>
